**Equilibrator
Temperature Sensor**

Location: Inserted into equilibrator ~5 cm below water level

Manufacturer: Hart

Model: 1521

Accuracy: 0.025 (°C if units not given)

Precision: 0.01 (°C if units not given)

Calibration: Factory calibration

Comments: Resolution is taken as Precision.

**Equilibrator
Pressure Sensor**

Location: Attached to equilibrator headspace. Differential pressure reading from Setra 239 attached to the equilibrator headspace is added to the pressure reading from the LICOR, which is measured by an external Setra 270 connected to the exit of the analyzer.

Manufacturer: Setra

Model: 270

Accuracy: 0.15 (hPa if units not given)

Precision: 0.015 (hPa if units not given)

Calibration: Factory calibration

Comments: Manufacturer's Resolution is taken as Precision.

**Additional
Information**

Suggested QC flag from Data Provider: NA

Additional Comments: System and some sensors (SBE21, SBE45) were not started until a couple days into the cruise and were turned off a couple days before the end of the cruise. ATM xCO₂ measurements were not very precise, which might have been caused by higher than normal gas flow. For this reason, All ATM xCO₂ have been flagged 3-Other see metadata. Otherwise, the system behaved well. Original Data Location: http://www.aoml.noaa.gov/ocd/ocdweb/brown/brown_introduction.html
